Sprint	Sprint 3 (Nov 4 to Nov 16, 2026)
AI interactions logged	8 (see summary below). Each entry links to the full chat, except Task 3.7 (see Appendix A.1).

Summary of entries

Task	Title	Purpose	Decision
3.1	Sprint 3 team guide and six personal task guides	Planning / documentation	Modified before use
3.2	Repo AI facts sheet of the real code state	Planning / prompt writing	[confirm]
3.3	Sprint 3 GitHub issues and sub-issue texts	Project management / documentation	Modified before use
3.4	Sprint 3 Gantt chart and plan cross-check	Planning / project management / testing	Modified before use
3.5	Creating this Sprint 3 AI log	Documentation	[confirm]
3.6	Gantt chart review, fixes and sharing	Project management / testing	[confirm]
3.7	Acceptance tests (SA-14) and Sprint 3 milestone	Project management / testing	[confirm]
3.8	Acceptance tests and frontend test setup (SA-13)	Testing / coding	[confirm]

Log entries

Task 3.1: Sprint 3 team guide and six personal task guides	
Purpose of AI Use	Planning and documentation: turning the Sprint 3 guidelines into a team guide and one personal guide per member, each with tasks, ideal hours, dependencies and step-by-step instructions, using what was learned from the Sprint 2 guides.
AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/254e4373-1119-4a4e-af3d-95f3f4d797f6 This is the same chat as Sprint 2 Task 2.1. It continues into Sprint 3, and this entry covers the Sprint 3 part.

AI-Suggested Content	A Team Guide plus six personal guides (Sayf, Kaila, Lamees, Youssef, Dany, Krish) with 43 tasks (about 84 hours), a master task table (owner, hours, dates, needs first, priority), a "GitHub issue: #" line above every task, an AI prompt for the repo AI on each task, an acceptance test format, and KA-9 (merging the two login helpers) with several step-by-step pathways. Later, the tasks for the AI feature (resume feedback) were added into the existing guides without rewriting them. Sayf chose the notifications scope (status-change and new-application notifications, plus an interview date set by the recruiter with a day-before reminder and no background timer) and chose to start, not finish, the AI feature in Sprint 3.
Validation	In Task 3.4 the Team Guide task table was compared with each personal guide. All 43 task IDs, owners, hours, priorities and needs-first lists matched, and the hours added up to 84 (Sayf 15.5, Dany 14.5, Kaila 14, Krish 13.5, Youssef 13.5, Lamees 13). Two open points were found: the label is spelled sprint-3 in the guides but Sprint-3 elsewhere, and the AI log folder is AI_Doc in the guide but AI_Log in the guidelines (to confirm with the TA).
Decision	Modified before use. Sayf made the scope decisions above and asked for the AI tasks to be added into the existing guides instead of rewriting them.
Reflection	Giving every task its hours, dependencies and a ready prompt lets teammates work without waiting for each other. The same numbers appear in seven documents, so a separate cross-check was needed to be sure they agree.
Responsible Person	Sayf

Task 3.2: Repo AI facts sheet of the real Sprint 3 code state (Nov 3)	
Purpose of AI Use	Prompt writing for a second AI that works inside the local repository, to produce a facts sheet of what was already implemented for the four Sprint 3 features before the guides were written, and to compare unmerged branches with main.
AI tool	Claude (Anthropic), used in claude.ai, for the prompts. The prompts were run by a second AI inside the local repository.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/254e4373-1119-4a4e-af3d-95f3f4d797f6 This is the same chat as Sprint 2 Task 2.1. It continues into Sprint 3, and this entry covers the Sprint 3 part.
AI-Suggested Content	A read-only prompt asking the repo AI to assess the code against the four Sprint 3 features and return a JSON facts sheet (status, what is implemented, what is missing, evidence files, contributors from git history). Further prompts to fetch the remote branches and compare each unmerged branch with origin/main by commit and by file. The repo AI's result, dated Nov 3, 2026: 2 features partial and 2 not started. Recruiters could already create postings, see applications for their own jobs and update a status through the backend. Missing: listing, editing and archiving postings, filters, changing a status from the dashboard page, and reviewing resumes. No notification or AI feedback code was found.
Validation	The facts sheet names the files and commits behind each claim, so each one could be opened and checked. The findings set the scope of the guides, for example the shared tasks KR-5 and DA-5 for merging and testing the real-API branch that was still unmerged while the main branch frontend files returned mock data.
Decision	[confirm: Accepted / Modified before use]

Reflection	Asking the repo AI for evidence (file paths and commit IDs) makes its report checkable instead of something to take on trust. Planning from the real code state, not from memory, avoided tasks for work that already existed.
Responsible Person	Sayf

Task 3.3: Sprint 3 GitHub issue structure and sub-issue texts (Nov 8)	
Purpose of AI Use	Project management: turning the four Sprint 3 features into GitHub issues, reusing the existing issues #22, #24, #18 and #20, and writing a paste-ready text for every sub-issue (title, assignee, labels, milestone, parent, description, build order).
AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/254e4373-1119-4a4e-af3d-95f3f4d797f6 This is the same chat as Sprint 2 Task 2.1. It continues into Sprint 3, and this entry covers the Sprint 3 part.
AI-Suggested Content	A structure of four feature stories plus one shared-work issue: #22 Recruiter Dashboard and Posting Management, #24 Application Analytics and History Dashboard, #18 Notifications and Reminders, #20 AI-Generated Resume Feedback. Full texts for the sub-issues of Stories 1 to 4 (YO-4 to YO-10, KR-6 to KR-11, LA-4 to LA-11, KA-6 to KA-13, DA-6 to DA-10, SA-20, AT-1 to AT-6) and SA-13, using the same task IDs as the guides. A script (create_sprint3_issues.py) and a plan file to create the issues with the GitHub CLI.
Validation	The AI could not reach GitHub from its workspace, so Sayf pasted screenshots of the existing issues and nothing was created by the AI. The texts were checked against the six personal guides. The checks showed that the first versions of YO-4, YO-5, YO-7, YO-9, KR-6 and KR-7 had been written from memory and did not match the guides, so they were rewritten from the guides. The story count was also wrong at first (six instead of the four features).
Decision	Modified before use. Wrong task texts were replaced after the check against the guides, and the six-story structure was changed to four stories on the existing issues.
Reflection	The AI wrote task titles from memory and was confidently wrong, so every task text had to be checked against the real guide. Reusing the existing issues kept the GitHub board and history in one place.
Responsible Person	Sayf

Task 3.4: Sprint 3 Gantt chart and plan cross-check (Nov 9)	
Purpose of AI Use	Planning and project management: building a Gantt chart of the Sprint 3 plan, then cross-checking the chart, the issue script and the issue texts against the Team Guide and the personal guides.
AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/254e4373-1119-4a4e-af3d-95f3f4d797f6 This is the same chat as Sprint 2 Task 2.1. It continues into Sprint 3, and this entry covers the Sprint 3 part.

AI-Suggested Content	An interactive Gantt chart page of all 43 tasks (bars by owner, P2 tasks striped, dependency arrows, longest chain, group by story or by person). A cross-check report. The report found wrong end dates in the issue script for 9 tasks (KA-9, SA-16, SA-13, KA-6, KR-5, DA-5, SA-12, SA-14, SA-17), missing, incomplete or placeholder dependencies for 15 tasks, one wrong date in the Story 3 text (KA-6) and an incomplete dependency list in the DA-9 text. It also corrected the critical path: the longest chain is KA-9, YO-4, KR-6, KR-7, DA-9, KR-9, not the AI chain.
Validation	The chart was built from the Team Guide task table. A script compared all 43 tasks with the issue script (owner, end date, dependencies), the hours were totalled per person, and the chart was opened in a browser at desktop and phone width in light and dark mode. The script was then patched with the plan's values. The plan documents were not changed.
Decision	Modified before use. The date and dependency errors were corrected in the script, and the chart was revised afterwards in Task 3.6.
Reflection	The cross-check reported the chart as clean, but a second review (Task 3.6) still found four small errors, so one AI check is not enough. Comparing a generated artifact with the source table by script was more reliable than rereading it.
Responsible Person	Sayf

Task 3.5: Creating this Sprint 3 AI log (Nov 12)	
Purpose of AI Use	Documentation: creating the Sprint 3 AI usage log as a new document in the same layout as the Sprint 1 and Sprint 2 logs, covering this chat and the other chats.
AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/254e4373-1119-4a4e-af3d-95f3f4d797f6 This is the same chat as Sprint 2 Task 2.1. It continues into Sprint 3, and this entry covers the Sprint 3 part.
AI-Suggested Content	This log, built from the Sprint 1 and Sprint 2 PDFs (cover table, summary table, one table per entry with the same eight fields). The Sprint 3 evidence rules from the guidelines (prompts, outputs, modifications, validation, decisions) were used to decide what each entry must show. The AI also answered whether the Sprint 3 contribution log exists: the Team Guide requires one file per member at Documentation/Sprint 3/Contribution Log - Name.md.
Validation	The layout and fields were compared with the two earlier logs. Entries for this chat come from the chat itself. The AI cannot open claude.ai share links, so the entries for the other chats come from text pasted by Sayf. Links and dates are to be opened and checked before submission.
Decision	[confirm: Accepted / Modified before use]
Reflection	The AI can only log what it can see. Any chat it cannot open has to be pasted in, and a share link should be opened in a browser to confirm it works before the log is handed in.
Responsible Person	Sayf

Task 3.6: Gantt chart review, fixes and sharing (Nov 10)	
Purpose of AI Use	Asking a second chat to check the Sprint 3 Gantt chart for accuracy, fix what was wrong, add progress tracking and explain how to share it with the team.

AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/5c032b63-bc3c-40ba-b97b-47cbef863fec
AI-Suggested Content	A review against the Team Guide and the personal guides. Matching: owners, hours, dates, priorities, needs-first lists, the 84-hour total and the weekends. Four small errors: KR-9 to YO-9 was drawn as a hard dependency although only the resume view part needs it; the link YO-10 to SA-20 was missing; the P2 figure showed 5 hours instead of about 8.5; SA-17 stopped on Nov 15 instead of running to Nov 16. Two display bugs: the P2 stripes in automatic dark mode and arrows that stayed at full strength when filtering by person. Then fixes plus a key dates row (Nov 5 kickoff, Nov 6 shared pieces merged, Nov 9 acceptance test drafts due, Nov 12 meeting, Nov 13 code complete, Nov 16 deadline), "also waits on" for SA-14, SA-15 and SA-18, tick boxes for merged tasks with a LATE tag, and a private published page with instructions for sharing (invite teammates as Editors by email; a public link only gives view access).
Validation	The AI tested the chart in a browser in light and dark mode, with a stand-in for the shared database and not on the live page, and advised ticking one task and checking it in a second browser or on a phone. [confirm: Sayf checked that ticks carry over in a second browser.]
Decision	[confirm: Accepted / Modified before use]
Reflection	A different review pass found four errors that the first check (Task 3.4) had missed. The plan check has to compare each rule in the guide, such as which part of a task needs which dependency, and not only the numbers.
Responsible Person	Sayf

Task 3.7: Acceptance tests (SA-14) and the Sprint 3 milestone (Nov 9)	
Purpose of AI Use	Understanding what task SA-14 (review and link the acceptance tests) asks, how a GitHub milestone works, and writing the description of the Sprint 3 milestone.
AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	No chat link available. The full prompts and responses are in Appendix A.1.
AI-Suggested Content	An explanation of the task text. Sayf mainly reviews and links the acceptance test (AT) issues; the owners write the drafts. Steps: remind the owners (Krish US-1, Youssef US-2, Dany US-3, Lamees US-4, Kaila US-5); check each draft (title [AT] story - scenario, labels acceptance-test, testing and sprint-3, links to its story and tasks, Given/When/Then, an "Automated test" line); add the Sprint 3 milestone and the board; add a checklist of AT issues in each story issue; write the US-6 acceptance test himself. Clarification that AT issues are assigned to the milestone and do not become milestones. A milestone description: Sprint 3, due Monday Nov 16, 2026, listing the features, unit tests, acceptance tests, CI, meeting minutes, contribution logs and AI log reports.
Validation	The answer was compared with the SA-14 task text in the Team Guide (screenshot pasted into the chat). [confirm: the milestone was created or edited on GitHub and the AT issues were assigned to it.]
Decision	[confirm: Accepted / Modified before use]

Reflection	Asking the AI to restate a task in plain words removed the confusion between a milestone and an issue. The definition of done (filter by acceptance-test and sprint-3 and see at least one test per story) is a clear way to check the result.
Responsible Person	Sayf

Task 3.8: Acceptance tests and frontend test setup (SA-13)	
Purpose of AI Use	Testing and coding: work on the acceptance tests and on the coding for task SA-13, the frontend test setup that the other frontend tasks depend on.
AI tool	Claude (Anthropic), used in claude.ai.
Chat Link or Prompt/Response	Chat link: https://claude.ai/share/90f9fd07-58d0-4bdb-80e3-0bac12898890
AI-Suggested Content	[confirm: what the AI produced in this chat.] The SA-13 task in the Sprint 3 guide covers: installing jsdom and Testing Library, adding a test section to the Vite config and a test setup file, a StatusBadge test for the five statuses, and an apiFetch test for the /api/v1 address and the Authorization header.
Validation	[confirm: how the output was checked.] The SA-13 task requires npm test, npm run lint and npm run build to pass, and a clean install (npm ci) followed by npm test to prove that the lockfile works.
Decision	[confirm: Accepted / Modified before use]
Reflection	[confirm: what was learned or what had to be corrected]
Responsible Person	Sayf

Appendices

Appendix A.1: Task 3.7, acceptance tests (SA-14) and the Sprint 3 milestone

Full prompts and responses of the chat that has no link (Nov 9, 2026). The screenshot was a picture of the SA-14 task text. Punctuation was simplified; the wording is unchanged.

Sayf	(with the screenshot Screenshot 2026-11-09 at 5.49.00PM.png of the SA-14 task text) just in case i misunderstood here, this means i make sure there is AT for each user story yes?

Claude	Yes, but your job is mainly reviewing and linking, not writing them. The owners write the drafts. Your part, in order: 1. Remind the owners (already due Nov 5): Krish (US-1), Youssef (US-2), Dany (US-3), Lamees (US-4), Kaila (US-5). 2. Check each draft as it arrives: - Title follows [AT] <story> - <scenario> - Labels: acceptance-test, testing, sprint-3 - Links to its story and its tasks - Clear Given / When / Then - An "Automated test" line (the test name, or "manual only") 3. Add the Sprint 3 milestone and put the issue on the board. 4. Link back from the story: in each story issue, add a checklist of its AT issues, so the link works in both directions. 5. US-6 is the exception. Once the AI feature is chosen, you create that acceptance test yourself. Done when: filtering issues by acceptance-test + sprint-3 shows at least one test for every story. Paste that filtered list link in your log. Since the drafts are due today, you can start checking them as soon as they come in.
Sayf	so i make the AT issues the milestones
Claude	Not quite. The milestone already exists, and it's called Sprint 3. You assign each AT issue to it; you don't turn the issues into milestones. On GitHub, open an AT issue, look at the right sidebar, click Milestone, and pick Sprint 3. Do that for each AT issue. A milestone is like a folder or bucket for a sprint. All the Sprint 3 issues (stories, tasks, and ATs) go into the same one, so you can see the sprint's progress in one place. If Sprint 3 doesn't show up in the list, it hasn't been created yet. You can make it under Issues > Milestones > New milestone, but check with your team first in case someone else is responsible for that.
Sayf	describe the milestone for me pls
Claude	Here's a description you can paste into the Sprint 3 milestone: Title: Sprint 3 Due date: Monday, November 16, 2026 Description: Sprint 3 of CareerNet (Nov 4 to Nov 16, 2026). This sprint covers: - Recruiter dashboard and job posting management (finishing what started in Sprint 2) - Application history and analytics dashboard for job seekers - Notifications and reminders (status changes, new applications, interview date with a day-before reminder) - Start of the AI feature: AI-generated resume feedback (to be finished in Sprint 4) Also included: unit tests, acceptance tests (at least one per story, labeled acceptance-test), CI, meeting minutes, contribution logs, and each member's AI log report. Every Sprint 3 story, task, and acceptance test issue belongs in this milestone. The last line is there so teammates know to tag their own issues too, which saves you from adding the milestone to everything yourself. If the course gave a different end time (for example 11:59 PM on the 16th), GitHub only stores the date, so the 16th is the right choice either way.
